## LISTING OF THE CLAIMS

- 18. (Previously Presented) A process for producing granular activated carbon by carbonization of suitable carbonaceous polymers in the form of polymer granules as a starting material, which polymer granules are convertible by carbonization into carbon, wherein the polymer granules are continuously moved through a carbonization apparatus comprising a plurality of temperature zones so that a complete conversion of the starting material to carbon is effected, wherein the carbonization apparatus comprises at least the following temperature zones in the following order:
  - a) a first temperature zone ("sulfonating zone") where in the case that the starting material contains no groups which, when thermally decomposed, lead to free radicals and thus to cross-linkages or else in the case that such groups are to be additionally introduced into the starting material, these groups are introduced into the starting material; then
  - b) a second temperature zone ("pre-carbonization zone" or "zone of acidic gases"), the second temperature zone having a higher average temperature than the first temperature zone, wherein in the second temperature zone the groups which, when thermally decomposed, lead to free radicals and thus to cross-linkages are split off from the starting material, so that carbonization and thermal decomposition of the starting material ensues, accompanied by crosslinking of the polymers and formation of carbon; and then
  - a third temperature zone ("post-carbonization zone"), the third carbonization zone having a higher average temperature than the second temperature zone, wherein in the third temperature zone further carbonization of the starting material resulting from the second temperature zone is performed, so that a complete conversion of the starting material to carbon is effected;

wherein the individual temperature zones are separately and independently controlled.

19. (Original) The process according to claim 18, wherein the carbonization apparatus used is

a continuous rotary tube or a continuous rotary tube oven.

20. (Original) The process according to claim 18, wherein the carbonization apparatus used is

a belt-oven.

21. (Original) The process according to claim 18, wherein the polymer granules are

continuously moved through the temperature zones of the carbonization apparatus by

means of transporting or conveying means.

22. (Original) The process according to claim 18, wherein the individual temperature zones

possess separate and independent exhaust means, so that the process gases from the

different temperature zones are separated and separately collected.

23. (Original) The process according to claim 18, wherein the carbonization apparatus

comprises at least one lock between individual successive temperature zones or within

individual temperature zones, so that there is at least essentially no mixing through of

process gases from different temperature zones between which at least one lock is

disposed.

24. (Original) The process according to claim 23, wherein at least one lock is present between

the second temperature zone and the third temperature zone, so that acidic process gases

from the second temperature zone are not mixed with other process gases.

25. (Original) The process according to claim 18, wherein process control is performed by

setting the temperature profile in the individual temperature zones.

Response to Final Office Action Application No. 10/567,794; Group Art Unit 1793

3 of 19

26. (Original) The process according to claim 18, wherein process control is performed by setting the speed at which the starting material moves through the temperature zones of the carbonization apparatus.

27. (Original) The process according to claim 18, wherein the total residence time of the starting material in the carbonization apparatus is in the range from 0.1 to 5 hours.

28. (Original) The process according to claim 18, wherein the first temperature zone is operated at temperatures in the range of from 50 to 200 °C.

29. (Original) The process according to claim 18, wherein the second temperature zone is operated at temperatures in the range of from 100 to 500 °C

30. (Currently Amended) The process according to claim 18, wherein the third temperature zone is operated at temperatures in the range of from 400 to 1.200-1,200°C.

31. (Original) The process according to claim 18, wherein in the first temperature zone the groups which, when thermally decomposed, lead to free radicals and thus to cross-linkages are sulfonic acid groups and are introduced into the starting material by sulfonation.

32. (Original) The process according to claim 18, wherein the starting material used comprises polymers in the form of polymer granules based on styrene and divinylbenzene and containing chemical groups which, when thermally decomposed, lead to free radicals and thus to cross-linkages.

33. (Original) The process according to claim 32, wherein the chemical groups leading to cross-linkages are sulfonic acid groups being already present in the starting material and wherein the weight ratio of polymers to sulfonic acid groups is in the range from 5:1 to 1:1.

34. (Original) The process according to claim 32, wherein the starting material used comprises

ion-exchanger resins having sulfonic acid groups or precursors of such ion-exchanger

resins.

35. (Original) The process according to claim 18, wherein the carbonized material is

subsequently subjected to an activation.

36. (Previously Presented) A process for producing granular activated carbon by carbonization

of suitable carbonaceous polymers in the form of polymer granules as a starting material,

which polymer granules are convertible by carbonization into carbon, wherein the polymer

granules are continuously moved through a carbonization apparatus comprising a plurality

of temperature zones so that a complete conversion of the starting material to carbon is

effected, wherein the carbonization apparatus comprises at least the following temperature

zones in the following order:

a) a first temperature zone ("sulfonating zone") where in the case that the starting

material contains no groups which, when thermally decomposed, lead to free radicals

and thus to cross-linkages or else in the case that such groups are to be additionally

introduced into the starting material, these groups are introduced into the starting

material; then

b) a second temperature zone ("pre-carbonization zone" or "zone of acidic gases"), the

second temperature zone having a higher average temperature than the first

temperature zone, wherein in the second temperature zone the groups which, when

thermally decomposed, lead to free radicals and thus to cross-linkages are split off

from the starting material, so that carbonization and thermal decomposition of the

starting material ensues, accompanied by crosslinking of the polymers and formation

of carbon; and then

Response to Final Office Action Application No. 10/567,794; Group Art Unit 1793

EES: 598276

c) a third temperature zone ("post-carbonization zone"), the third carbonization zone

having a higher average temperature than the second temperature zone, wherein in the

third temperature zone further carbonization of the starting material resulting from the

second temperature zone is performed, so that a complete conversion of the starting

material to carbon is effected;

wherein the individual temperature zones are separately and independently controlled,

the carbonization apparatus further comprising at least one lock between individual

successive temperature zones or within individual temperature zones, so that there is at

least essentially no mixing through of process gases from different temperature zones

between which said at least one lock is disposed.

37. (Previously Presented) A process for producing granular activated carbon by carbonization

of suitable carbonaceous polymers in the form of polymer granules as a starting material,

which polymer granules are convertible by carbonization into carbon, wherein the polymer

granules are continuously moved through a carbonization apparatus comprising a plurality

of temperature zones so that a complete conversion of the starting material to carbon is

effected, wherein the carbonization apparatus comprises at least the following temperature

zones in the following order:

a) a first temperature zone ("sulfonating zone") where in the case that the starting

material contains no groups which, when thermally decomposed, lead to free radicals

and thus to cross-linkages or else in the case that such groups are to be additionally

introduced into the starting material, these groups are introduced into the starting

material; then

b) a second temperature zone ("pre-carbonization zone" or "zone of acidic gases"), the

second temperature zone having a higher average temperature than the first

temperature zone, wherein in the second temperature zone the groups which, when

Response to Final Office Action Application No. 10/567,794; Group Art Unit 1793 thermally decomposed, lead to free radicals and thus to cross-linkages are split off

from the starting material, so that carbonization and thermal decomposition of the

starting material ensues, accompanied by crosslinking of the polymers and formation

of carbon; and then

c) a third temperature zone ("post-carbonization zone"), the third carbonization zone

having a higher average temperature than the second temperature zone, wherein in the

third temperature zone further carbonization of the starting material resulting from the

second temperature zone is performed, so that a complete conversion of the starting

material to carbon is effected;

wherein the individual temperature zones are separately and independently controlled,

with at least one lock being present between the second temperature zone and the third

temperature zone, so that acidic process gases from the second temperature zone are not

mixed with other process gases.
